```
construct comprising nucleic acids encoding the human papillomavirus (HPV) cytotoxic Tlymphocyte (CTL) epitopes e.g., HPV16.E1.214, and that are directly or indirectly joined to one another in the same reading frame, a vaccine minigene. Also included are a vector comprising the multi-epitope construct, a polypeptide comprising an amino acid sequence encoded by the polynucleotide, a composition (comprising the polynucleotide, vector and/or polypeptide and a carrier), a cell (comprising the polynucleotide, vector or polypeptide), inducing an immune response against human papillomavirus virus (HPV) and making the polynucleotide, vector or polypeptide. The epitopes are derived from different strains of HPV and are from the El, E2, E6 and E7 proteins. The epitopes may be linked via a GP-anchor/spacer peptide. The order of the epitopes in the vaccine protein are disclosed in the tables referred to in the claims of the specification. The polynucleotide, vector or polypeptide is useful in preparing a composition for inducing an immune response against human papillomavirus virus (HPV) and thus providing a defense against human papillomavirus virus (HPV) and thus providing a defense against hyp infection and HPV-related cancers. The present sequence is an HPV protein used to derive epitopes for the vaccine of the

The epitopes are derived from different strains of HPV and are from the El, E2, E6 and E7 proteins. The epitopes may be linked via a GP-anchor/spacer peptide. The order of the epitopes in the vaccine protein are disclosed in the tables referred to in the claims of the specification. The polynucleotide, vector or polypeptide is useful in preparing a composition for inducing an immune response against HPV infection and HPV-related cancers. The present sequence is an HPV protein used to derive epitopes for the vaccine of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chesnut Chen Y,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a new polynucleotide comprising a multi-epitope construct comprising nucleic acids encoding the human papillomavirus (HPV) cytocoxic Tlymphocyte (CTL) epitopes e.g., HPV16.B1.214, and that are directly or indirectly joined to one another in the same reading frame, a vaccine minigene. Also included are a vector comprising the

                                                                                                                                   of the monoclonal antibodies specifically binds to 86 proteins of at diagnostic kit (for detecting an HPV strains. Also included are a diagnostic kit (for detecting an HPV strains). Also included are a composition to the trains above), a method of detecting an HPV st polypeptide in a sample, a method of detecting the presence of an oncogenic HPV 86 protein in a sample and a system for detecting the presence of an oncogenic HPV st polypeptide in a sample (comprising a first and a second binding partner for an oncogenic HPV st polypeptide, where the first binding partner is a PDZ domain protein and the second binding partner is an antibody that specifically binds to the 86 proteins of at least three different oncogenic HPV strains). The antibody composition, kit, methods, and system are useful for diagnosing cancer, particularly cervical cancer. The present sequence is an HPV E6 protein.

The variant is preferably a deletion mutant comprising at least half, and preferably two thirds of full length E6 or E7 protein starting from the N- or C-terminal, or is a full length E6 molety fused to a full length E7 molety. The variant optionally has a linkage molety and a foreign protein or peptide which facilitates the purification of, and enhances the immunogenicity of, the fusion protein. This sequence is a fusion protein of the C-terminal end of E7 and the N-terminal end of E6. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      27-AUG-2003

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ADO44074-ADO44085 represent E6 polypeptides from human papillomaviruses. C2 ADO44098 is the consensus sequence derived from these polypeptides. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E8 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                                                                                                                                                                                            Matches

The variant is preferably a deletion mutant comprising at least half, and preferably two thirds of full length E6 or E7 protein starting from the N- or C- terminal, or is a full length E6 moiety fused to a full length E7 moiety. The variant optionally has a linkage moiety and a foreign protein or peptide which facilitates the purification of, and enhances the immunogenicity of, the fusion protein. This is a fusion protein of the C-terminal end of E6 and the N-terminal end of E7. The protein is also a delicition where the purification of the C-terminal end of E6 and the N-terminal end of E7. The protein is also a delicition where the protein is also a delicition where the protein is also a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AD044074 AD044085 represent E6 polypeptides from human papillomaviruses. CC AD044098 is the consensus sequence derived from these polypeptides. The CS specification describes human papillomavirus E6 and E7 polypeptides, CC where the E7 polypeptide has mutations at any one or more of the amino acids 24, 26 or 91 of the sequence given in CC AD044073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of CC one or more of the amino acids corresponding to amino acids 63 or 106 of CC there sequence given in AD044072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV) associated CC cancers, such as cervical cancer. The fusion proteins are useful for generating immune responses CC encoding the fusion proteins are useful for generating immune responses CC cagainst HPV. They are also useful for treating lower gastrointestinal CC tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an antibody composition comprising a mixture of CC monoclonal antibodies that specifically bind to E6 proteins of human CC papilloma virus (HPV) strains 16, 18, 31, 33 and 45, where at least one CC of the monoclonal antibodies specifically binds to E6 proteins of at CC diagnostic kit (for detecting an HPV E6 polypeptide in a sample, CC comprising the antibody composition above), a method of detecting an HPV CC E6 protein in a sample, a method of detecting the presence of an oncogenic HPV E6 polypeptide in a sample (comprising the CC presence of an oncogenic HPV E6 polypeptide in a sample (comprising a CC first and a second binding partner for an oncogenic HPV E6 polypeptide, where the first binding partner is a PDZ domain protein and the second CC binding partner is an antibody that specifically binds to the E6 proteins of at least three different oncogenic HPV E7 and the second CC composition, kit, methods, and system are useful for diagnosing cancer, CC particularly cervical cancer. The present sequence is an HPV E6 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

                                                                                                                                                                                                                                                                                                                                                               CC AD044074-AD044085 represent E6 polypeptides from human papillomaviruses.
CC AD044098 is the consensus sequence derived from these polypeptides. The grecification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino cc acids corresponding to amino acids 24, 26 or 91 of the sequence given in CC AD044073 and the E6 polypeptide has no mutations or has mutations at any cone or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in AD044072 The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated CC cancers, such as cervical cancer. The fusion proteins and nucleic acids CC encoding the fusion proteins are useful for generating immune responses CC against HPV. They are also useful for treating lower gastrointestinal CC tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancers.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC monoclonal antibodies that specifically bind to E6 proteins of human CC papilloma virus (HPV) strains 16, 18, 31, 33 and 45, where at least one CC of the monoclonal antibodies specifically binds to E6 proteins of at CC least three different oncogenic HPV strains. Also included are a CC diagnostic kit (for detecting an HPV E6 polypeptide in a sample, CC comprising the antibody composition above), a method of detecting an HPV E6 protein in a sample, a method of detecting the presence of an CC oncogenic HPV E6 protein in a sample and a system for detecting the presence of an CC oncogenic HPV E6 polypeptide in a sample (comprising a CC first and a second binding partner for an oncogenic HPV E6 polypeptide. CC where the first binding partner is a PDZ domain protein and the second CC binding partner is an antibody that specifically binds to the E6 proteins CC of at least three different concogenic HPV E7 and the second CC composition, kit, methods, and system are useful for diagnosing cancer, CC particularly cervical cancer. The present sequence is an HPV E6 protein.

                                                                                                                                                                                                                                                                                                          The invention relates to a new polynucleotide comprising a multi-epitope CC construct comprising nucleic acids encoding the human papillomavirus CC (HPV) cytotoxic T lymphocyte (CTL) epitopes e.g., HPV16.E1.214, and that CC are directly or indirectly joined to one another in the same reading CC frame, a vaccine minigene. Also included are a vector comprising the CC multi-epitope construct, a polypeptide comprising an amino acid sequence ce encoded by the polynucleotide, a composition (comprising the CC polynucleotide, vector and/or polypeptide and a carrier), a cell CC comprising the polynucleotide, vector or polypeptide, inducing an CC immune response against human papillomavirus virus (HPV) and making the CC epitopes may be linked via a GP-anchor/spacer peptide. The crited from CC epitopes may be linked via a GP-anchor/spacer peptide. The crited to comprising the specification. The polynucleotide, vector or polypeptide in the tables referred to in the claims of the specification. The polynucleotide, vector or composition for inducing an immune cesponse against human papillomavirus virus (HPV) and thus providing a defense against human papillomavirus virus (HPV) and thus providing a composition of the present sequence is an HPV infection and HPV-related cancers. The present in the vaccine of the convertion of the vaccine of the convertion.
                                                                밁
                                                                                                                                  밁
                                                                                                                                                             S

Probes and primers based on these sequences were used for HPV infection diagnosis; expression of E6 and E7 is diagnostic for cervical cancer or pre- malignant states.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     HPV-18 E6 cDNA (given in AAQ97848) was amplified from a HeIa cell cDNA library using the primers given in AAQ97846-47. The gene was subcloned into a baculovirus vector for expression of recombinant E6 in Sf9 insect cells for use as a component of an in vitro ubiquitin conjugating system. (Updated on 25-MAR-2003 to correct PN field.)

The ubiquitin-conjugating system comprises: (a) a reconstituted protein mixture including a ubiquitin conjugating enzyme (UDCE) produced by the expression of a nucleic acid which hybridizes under high stringency conditions to human UDCE, Candida albicans UDCE, or Schizosaccharomyces pombe UDCE coding sequences; (b) a regulatory protein; and (c) ubiquitin. The polymucleotides are useful for identifying ubiquitination inhibitors. The polymucleotides, on polypeptides, antisense compounds and antibodies against them may also be useful for the treatment and/or diagnosis of proliferative disorders (e.g. cancer, atherosclerosis, or restenosis) tissue connective disorders, controlling wound healing, and disorders characterized by fibrosis (e.g. rheumatoid arthritis, insulin dependent diabetes mellitus, glomerulonephritis,
                                                                  HPV-18 E6; ubiquitin mediated proteolysis; human; cellular protein half life; ubiquitination inhibitor; p53; cyclin; cell cycle regulator; myc deregulation; human papillomavirus; cell cycle regulator; myc deregulation; human papillomavirus; HPV-18 E6 protein; cervical cancer; skin cancer; epidermal hyperplasia; epidermal neoplasia; psoriasis; connective tissue disorder; wound healing; cytostatic; antiproliferative; anticancer; antipsoriatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 158 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cirrhosis, and scleroderma)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence is the human papillomavirus E6 protein. The invention relates to assays for identifying an inhibitor of ubiquitin-mediated proteolysis of a cell-cycle regulatory protein comprising contacting a candidate agent with an ubiquitin-conjugating system and measuring the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 1999-590402/50

cc ubiquitin-mediated proteolysis of a cell cycle regulatory protein capent. The eukaryotic cells is engineered eukaryotic cell with a candidate capent. The eukaryotic cells is engineered to express a recombinant human, candida albicans or Schizosaccharomyces pombe ubiquitin. Conjugating cenzyme (AAB03199-B03171), a cell cycle regulatory protein (such as p53) cand ubiquitin. The specification also discloses novel Candida albicans cell cycle regulatory protein (such as p53) cand chizosaccharomyces pombe ubiquitin conjugating capymes, hubcE and rapUBC (AAB03171), and two novel human ubiquitin-conjugating enzymes, caubCE and spUbCE (AAB03170, AAB03171), and two novel human ubiquitin-conjugating controlled cell degradation of intracellular proteins in eukaryotic cells. In particular, this system controlling the lavels of proteins involved in cell cycle important in controlling the lavels of proteins involved in cell cycle progression. Alterations in the development of cancers. For example, human cell cycle progression. Alterations in the development of cancers. For example, human capabillomaviruses such as HPV-18 encode a transforming protein. E6 (AAB03176), which combines with a cellular E6-associated protein (E6-AP; (AAB03177)) to stimulate the ubiquitination of p53, thus targetting it for connective tissue disorders and for controlling the wound healing connective tissue disorders and for controlling the wound healing conditions such as psoriasis, neoplastic epidermal conditions, skin cancers e.g., basal cell carcinomas, squamous cell carcinomas. The cells and cause apoptosis to occur. Inhibitors of balance of transformed cells and cause apoptosis to occur. Inhibitors of ubiquitin-cordinated degradation of cyclins are useful as antiproliferative agents. The present sequence represents HPV-18 E6 protein. (Updated on 12-SEP-2003 to standardise OS field)

                                                                                                                                                                                                       ફ
                                                                                                                                                                                                                                                 CC treatment of prophylaxis of HPV infection, in persons who have not CC manifested symptoms e.g. genital warts or neoplastic growth. The peptides CC can also be used in a tetramer staining assay to assess peripheral blood CC mononuclear cells for the presence of antigen-specific CTLs following CC exposure to a pathogen or immunogen, and as reagents to evaluate immune CC recall responses or evaluate the efficacy of a vaccine. The vaccine CC compositions are useful for removing warts or treating HPV infections. CC The epitopes for inclusion in an epitope-base vaccine may be selected CC from conserved regions of viral or tumour-associated antigens, which CC reduces the likelihood of escape mutants, also immunosuppressive epitopes that may be present in whole antigens can be avoided with the use of CC epitope-base vaccines. An additional advantage is the ability to combine CC epitopes achieving enhanced immunogenicity, the major benefit of the CC vaccine is that is safe and efficacious. AAB99391 to AAB9477 represent construction of the present construction of the present construction of the present construction.

                                                  ADO44074-ADO44085 represent E6 polypeptides from human papillomaviruses. ADO44098 is the consensus sequence derived from these polypeptides. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids corresponding to amino acids 24, 26 or 91 of the sequence given in ADO44073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in ADO44072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and mucleic acids encoding the fusion proteins are useful for generating immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an antibody composition comprising a mixture of CC monoclonal antibodies that specifically bind to E6 proteins of human CC papilloma virus (HPV) strains 16, 18, 31, 33 and 45, where at least one CC papilloma virus (HPV) strains 16, 18, 31, 33 and 45, where at least one CC of the monoclonal antibodies specifically binds to E6 proteins of at CC class three different oncogenic HPV strains. Also included are a CC diagnostic kit (for detecting an HPV E6 polypeptide in a sample, CC comprising the antibody composition above), a method of detecting an HPV CC E6 protein in a sample, a method of detecting the presence of an oncogenic HPV E6 protein as a system for detecting the CC presence of an oncogenic HPV E6 polypeptide in a sample (comprising a CC first and a second binding partner for an oncogenic HPV E6 polypeptide, CC where the first binding partner is a DDZ domain protein and the second CC binding partner is an antibody that specifically binds to the E6 proteins of at least three different oncogenic HPV strains). The antibody CC composition, kit, methods, and system are useful for diagnosing cancer, CC particularly cervical cancer. The present sequence is an HPV E6 protein.

                                                                                                                                                                                            á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC The invention relates to a method of producing a synthetic protein CC comprising an amino acid sequence that is at least 80% identical to a CC naturally occurring antigenic protein of a pathogen or tumor comprising CC chemically synthesizing two or more fragments, chemically ligating the C-cterminus of a fragment to the N-terminus of a neighboring fragment to comproduce the synthetic protein or its part and optionally repeating the C-cterminus of step to sequentially ligate a further neighboring fragment to obtained from the second step. The invention also relates to a composition comprising the protein and a method for treating or CC preventing human papillomavirus (HPV) associated disease by administering CC to the subject the protein or composition in a therapeutically effective amount. In producing a synthetic protein, the neighboring non-overlapping CC residues. The naturally occurring protein, the neighboring non-overlapping CC residues. The naturally occurring protein is an HPV protein e.g. E2, E6 CC residues. The naturally occurring protein is an HPV protein, e.g. E2, E6 CC residues. The naturally occurring protein is an HPV subscition is useful as a coccine for preventing or treating HPV associated disease, such as a confert. This sequence represents an HPV18 E6 protein used in the method conference in the invention.
                                                                                                                                                                                                                                                                                                   Query Match

       multi-epitope construct, a polypeptide comprising an amino acid sequence encoded by the polynucleotide, a composition (comprising the polynucleotide, vector and/or polypeptide and a carrier), a cell (comprising the polynucleotide, vector or polypeptide), inducing an immune response against human papillomavirus virus (HPV) and making the polynucleotide, vector or polypeptide. The epitopes are derived from different strains of HPV and are from the El, E2, E6 and E7 proceins. The epitopes may be linked via a GP-anchor/spacer peptide. The order of the epitopes in the vaccine protein are disclosed in the tables referred to in the claims of the specification. The polynucleotide, vector or polypeptide is useful in preparing a composition for inducing an immune response against HPV infection and HPV-related cancers. The present sequence is an HPV protein used to derive epitopes for the vaccine of the
                                                                                                                                                                                                                The invention relates to a new polynucleotide comprising a multi-epitope construct comprising nucleic acids encoding the human papillomavirus (HPV) cytotoxic T lymphocyte (CTL) epitopes e.g., HPV16.B1.214, and that are directly or indirectly joined to one another in the same reading frame, a vaccine minigene. Also included are a vector comprising the
                                                                                                                                                                                                                                                                                                                                                                                                    WPI; 2005-658982/67.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human papillomavirus type 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human papilloma virus infection; virucide; cancer; cytostatic; vaccine; epitope mapping; immune stimulation; cytotoxic T-lymphocyte.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              HPV_18 Envelope

                                                   A new DNA sequence encoding a fusion protein comprising a mutagenized HPV (human papillomavirus) E6 or E7 coding sequence and a sequence encoding a highly immunogenic fusion partner is useful to vaccinate against HPV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    multi-epitope construct, a polypeptide comprising an amino acid sequence encoded by the polynucleotide, a composition (comprising the polynucleotide, vector and/or polypeptide and a carrier), a cell (comprising the polynucleotide, vector or polypeptide), inducing an immune response against human papillomavirus virus (HPV) and making the polynucleotide, vector or polypeptide. The epitopes are derived from different strains of HPV and are from the El, E2, E6 and E7 proteins. The epitopes may be linked via a GP-anchor/spacer peptide. The order of the epitopes in the vaccine protein are disclosed in the tables referred to in the claims of the specification. The polynucleotide, vector or polypeptide is useful in preparing a composition for inducing an immune response against HPV infection and HPV-related cancers. The present sequence is an HPV protein used to derive epitopes for the vaccine of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a new DNA sequence encodes an B6 or E7 fusion protein of HPV, where at least 20% of the original codons are replaced by codons which lead to enhanced translation in a mammalian cell, containing a mutation which results in production of a truncated non-functional protein, and encoding a highly immunogenic polypeptide fusion partner capable of enhancing immunogenicity of the E6 or E7 protein in the mammalian host. The invention is used as a vaccine for the prevention or treatment of an HPV infection or a neoplasm associated with HPV infection. This sequence represents the human papillomavirus-18 (HPV18) EE6T-protein sequence of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PCR from plasmid pbR322/HPV16 (Boshart et al., EMBO J. 3: 1151) using oligonucleotides SO1 and SO2. The prod. of the second reading frame is the HPV-18 E7 protein whereas the third reading frame encodes HPV-18 E6. The E6 and E7 ORFs are fused together to form a single continuous ORF via site directed mutagenesis and the immortilising potential of E7 is removed by altering two key codons of the HPV E7 sequence. The single ORF of HPV-18 E6/E7 may be inserted into vaccinia virus DNA at neutral sites (pref. by inserting two sets of the DNA in opposite orientations to overcome the problem of intertypic recombination) to make a recombinant virus vector for use immunotherapeutically to activate cells of the immune system against HPV. See also AAR27723-43. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 24-OCT-2003 to standardise OS field)
AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAY25375-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG
                                                                                                                 Composition comprising induce immune response

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    oligonucleotide. The products of the invention can be used to immune response in a patient to an HPV antigen. They can also preventing or treating HPV induced tumours
                                            This sequence represents a chimeric E6 or E7 protein or E6/E7 fusion protein from Human papillomavirus (HPV) linked to an immunological fusion partner, in this case, a fragment of the Haemophilus influenzae B protein D. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immunotherapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection.                                                                                                                 The invention relates to human Papilloma virus (HPV) fusion proteins, linked to an immunological fusion partner that provides T helper epitopes to the HPV antigen. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence represents an HPV-H. influenzae D protein, fusion protein of the

                                                                                                                                                                                                                   AAX78791-X78801 represent nucleic acid sequences which encode novel constructs comprising an E6 or E7 protein or E6/E7 fusion protein from HPV (represented in AAY25375-Y25386). These constructs are optionally linked to an immunological fusion partner and an immunomodulatory CpG oligonucleotide. The products of the invention can be used to induce arimmune response in a patient to an HPV antigen. They can also be used i preventing or treating HPV induced tumours
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAY25386

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence represents a chimeric B6 or B7 protein or B6/E7 fusion protein from Human papillomavirus (HPV) linked to an immunological fusion partner, in this case, a fragment of the Haemophilus influenzae B protein D. The sequence also contains a histidine tag at the C-terminus of the encoded protein. The protein can be used in a vaccine, for immunotherapeutically treating HPV induced tumour lesions (benign or malignant) and preventing HPV viral infection. Vaccine formulations comprising the fusion proteins are useful in the treatment or prophylaxis of HPV induced lesions (papillomas, warts and cervical cancer). HPV 16 (and HPV 18) E6 and E7 proteins (singly, as an E6-E7 fusion or mutated) were fused to either Haemophilus influenzae D protein (20-127), the C-terminus of Streptococcus pneumoniae Lyth protein (CLyth) or thioredoxin. The present sequence represents an HPV-H. influenzae D protein, fusion protein of the

                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an antibody composition comprising a mixture of CC monoclonal antibodies that specifically bind to E6 proteins of human CC papilloma virus (HPV) strains 16, 18, 31, 33 and 45, where at least one CC of the monoclonal antibodies specifically binds to E6 proteins of at CC least three different oncogenic HPV strains. Also included are a CC diagnostic kit (for detecting an HPV E6 polypeptide in a sample, CC comprising the antibody composition above), a method of detecting an HPV CC E6 protein in a sample, a method of detecting the presence of an oncogenic HPV E6 polypeptide in a sample (comprising a CC first and a second binding partner for an oncogenic HPV E6 polypeptide, CC where the first binding partner is a PDZ domain protein and the second CC where the first binding partner is a PDZ domain protein and the second CC binding partner is an antibody that specifically binds to the E6 proteins of at least three different oncogenic HPV Extrains). The antibody CC composition, kit, methods, and system are useful for diagnosing cancer, CC particularly cervical cancer. The present sequence is an HPV E6 protein.
                                                                                                                                                                                                                                                                                                            Query Match

The method comprises administering to the patient an immunoglobulin (Ig) or its portion where the Ig has at least one peptide epitope of the antigen attached to the Ig or its portion and administering the immunoglobulin or its portion in conjunction with a RNA segment. The present sequence is an antigen sequence, used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Generating an immune response to an antigen, useful for generating desired T cell responses comprises administering an immunoglobulin one peptide epitope of the antigen attached to the immunoglobulin.
                                                                                                                                                                                                                                             E6 protein; E7 protein; fusion protein; HPV; HPV-associated cancer; cervical cancer; immune response; lower gastrointestinal tract cancanal cancer; reproductive system cancer; penile cancer; vulvar cancer; penile cancer; vulvar cancanal cancer; reproductive system cancer; penile cancer; vulvar cancanal cancer; reproductive system cancer; penile cancer; vulvar cancer; penile cancer;

AD044098 is the consensus sequence derived from these polypeptides. The specification describes human papillomavirus E6 and E7 polypeptides, where the E7 polypeptide has mutations at any one or more of the amino acids 24, 26 or 91 of the sequence given in AD044073 and the E6 polypeptide has no mutations or has mutations at any one or more of the amino acids corresponding to amino acids 63 or 106 of there sequence given in AD044072. The polypeptides of the invention are useful for treating or preventing human papillomavirus (HPV)-associated cancers, such as cervical cancer. The fusion proteins and nucleic acids encoding the fusion proteins are useful for representing immune responses against HPV. They are also useful for treating lower gastrointestinal tract cancers, e.g. anal cancer, and other cancers of the reproductive system, including penile and vulvar cancer.
                                                                                                                                                                                                             Human papillomavirus.
                                                                                                                                                                                                                                                                     Cytostatic; Virucide; Antibacterial; Antiparasitic; Vaccine; infection;

                                                                                                      S
                                                                                                                                                     밁
                                                                                                                                                                                       S
                                                                                                                                                                                                                                                                                                              receptor DEC-205. The method comprises exposing dendritic cells from the mammal to either: a conjugate comprising a preselected antigen covalently bound to an antibody to DEC-205; or a recombinant anti-DEC-205 antibody genetically engineered to contain at least one preselected antigen on at least one preselected site on the antibody molecule; and promoting maturation of the dendritic cells. The sequence encoding an anti-DEC-205 antibody (fragment) is preferably selected from ADV8563; which encode the heavy or light chain variable region of an anti-DEC-205 antibody. The antigen is targeted to antigen presenting cells through the inclusion of the anti-DEC-205 antibody, making antigen presentation chighly efficient. The immunity induced is robust and long lasting, even from a single dose at low concentration. The method of the invention is useful for immunizing a mammal to prevent or treat a disease such as a cuiral, bacterial or other infection or cancer. The immunization present sequence is a HPV protein sequence which can be
                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                    Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a method (M1) for promoting highly efficient antigen presentation in a mammal, by targeting a presenced antigen to an endocytic receptor on an antigen-presenting cell, e.g. a dendritic cell. An example of a dendritic cell is the cell endocytic receptor DEC-205. The method comprises exposing dendritic cells from the
                                                                                                                                                                                                                                                                                                          Sequence 158 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (HAWI/)
